OXFORD

Experimental Design *for the* Life Sciences

Graeme D. Ruxton & Nick Colegrave

Fourth Edition

Contents

1 Why you should care about design 1

1.1 Why experiments need to be designed 1

1.2 The costs of poor design 3

1.2.1 Time and money 3

1.2.2 Ethical issues 3

1.3 The relationship between experimental design and statistics 4

1.4 Why good experimental design is particularly important to life scientists 5

1.4.1 Random variation 5

1.4.2 Confounding factors 6

1.4.3 Simpson's paradox 7

1.5 Subjects, experimental units, samples, and terminology 9

Summary 11

2 Starting with a well-defined hypothesis 13

2.1 Why your study should be focused: questions, hypotheses, and predictions 13

2.1.1 An example of moving from a question to hypotheses, and then to an experimental design 14

2.1.2 An example of multiple hypotheses 16

2.1.3 Where do (good) ideas come from in the first place? 18

2.2 Producing the strongest evidence with which to challenge a hypothesis 20

2.2.1 Indirect measures 20

2.2.2 Considering all possible outcomes of an experiment 21

2.2.3 Satisfying sceptics 22

2.3 Controls 23

2.3.1 Different types of control 23

2.3.2 Making sure the control is as effective as possible 26
2.3.3 The ethics of controlling 27
2.3.4 Situations where a control is not required 27

2.4 The importance of a pilot study and preliminary data 28
2.4.1 Making sure that you are asking a sensible question 28
2.4.2 Making sure that your techniques work 29
Summary 31

3 Selecting the broad design of your study 32

3.1 Experimental manipulation versus natural variation 32
3.1.1 An example hypothesis that could be tackled by either manipulation or correlation 32
3.1.2 Arguments for doing a correlational study 33
3.1.3 Arguments for doing a manipulative study 35
3.1.4 Situations where manipulation is impossible 38

3.2 Deciding whether to work in the field or the laboratory 41

3.3 *In vivo* versus *in vitro* studies 43

3.4 There is no perfect study 43
Summary 44

4 Between-individual variation, replication, and sampling 46

4.1 Between-individual variation 46

4.2 Replication 47

4.3 Selecting a sample 57
4.3.1 Simple random sampling 57
4.3.2 Remember, you want a representative sample 58
4.3.3 Stratified sampling 59
4.3.4 Cluster sampling 61
4.3.5 Convenience sampling 63
4.3.6 Self-selection 64
Summary 65

5 Pseudoreplication 67

5.1 Explaining what independence and pseudoreplication are 67

5.2 Common sources of pseudoreplication 70
5.2.1 A shared enclosure 70
5.2.2 The common environment 71
5.2.3 Relatedness 72
5.2.4 A pseudoreplicated stimulus 72
5.2.5 Individuals are part of the environment too 72
5.2.6 Pseudoreplication of measurements through time 73
5.2.7 Species comparisons and pseudoreplication 73

5.3 Dealing with non-independence 74
5.3.1 Independence of replicates is a biological issue 74

5.4 Accepting that sometimes replication is impractical 76

5.5 Pseudoreplication, third variables, and confounding variables 77

5.6 Cohort effects, confounding variables, and cross-sectional studies 78
Summary 79

6 Sample size, power, and efficient design 81

6.1 Selecting the appropriate number of replicates 81
6.1.1 Educated guesswork 82
6.1.2 Formal power analysis 82

6.2 Factors affecting the power of an experiment 82

6.3 Working out the power of a planned study 84
6.3.1 Determining the likely effect size 85
6.3.2 How much variation? 86
6.3.3 Experimental design 87
6.3.4 How many replicates? 87
6.3.5 Imaginary experiments 88

6.4 Improving the power of a study 91
6.4.1 Reducing random variation 92
6.4.2 Dealing with variation through design 94
6.4.3 Increasing the effect size 95
6.4.4 Consider all other ways of increasing power before increasing sample sizes 97
6.5 Comparing the power of different planned studies 98
Summary 100

7 The simplest type of experimental design: completely randomized, single-factor 101
7.1 Completely randomized single-factor designs 102
7.2 Randomization 102
7.2.1 Randomizing study subjects 102
7.2.2 Randomizing other aspects of your study 103
7.2.3 Haphazard allocation 104
7.2.4 Balanced and unbalanced allocation 105
7.3 Factors with more than one level 106
7.4 Advantages and disadvantages of complete randomization 107
Summary 108

8 Experiments with several factors (factorial designs) 109
8.1 Randomized designs with more than one factor 109
8.2 Interactions 110
8.3 Confusing levels and factors 117
8.4 Split-plot designs (sometimes called split-unit designs) 119
8.5 Latin square designs 121
8.6 Thinking about the statistics 123
Summary 125

9 Beyond complete randomization: blocking and covariates 127
9.1 The concept of blocking on a particular variable 128
9.2 Blocking on individual characters, space, and time 131
9.3 The advantages and disadvantages of blocking 132
9.4 Paired designs 133
9.5 How to select blocks 133
9.6 Covariates 134
9.7 Interactions between covariates and factors 138
Summary 140

10 Within-subject designs 141
10.1 What do we mean by a within-subject design? 141
10.2 The advantages of a within-subject design 142
10.3 The disadvantages of a within-subject design 142
10.3.1 Period effects 142
10.3.2 Carry-over effects 144
10.4 Isn't repeatedly measuring the same individual pseudoreplication? 146
10.5 With multiple treatments, within-subject experiments can take a long time 147
10.6 Which sequences should you use? 147
10.7 Within-subject designs and randomized block designs 148
10.8 It is possible to design experiments that mix within-subject and between-subject effects 149
Summary 150

11 Taking measurements 152

11.1 Calibration 153

11.2 Inaccuracy and imprecision 154

11.2.1 Subsampling: more woods or more trees? 157

11.3 Sensitivity and specificity 159

11.4 Intra-observer variability 162

11.4.1 Describing the problem 162

11.4.2 Tackling the problem 163

11.4.3 Repeatability 163

11.4.4 Remember, you can be consistent but still consistently wrong 164

11.5 Inter-observer variability 166

11.5.1 Describing the problem 166

11.5.2 Tackling the problem 166

11.6 Deciding how to measure 167

11.6.1 Defining categories 167

11.6.2 How fine-scale to make measurements of continuous variables 168

11.6.3 Observer bias and blinding 168

11.6.4 Allocation concealment 171

11.6.5 Floor and ceiling effects 172

11.6.6 Observer effects 173

11.7 Pitfalls to avoid when recording data 174

11.7.1 Don't try to record too much information at once 175

11.7.2 Beware of shorthand codes 175

11.7.3 Keep more than one copy of your data 175

11.7.4 Write out your experimental protocol formally and in detail, and keep a detailed field journal or lab book 176

11.7.5 Don't overwork 176

11.7.6 Take care to check computers and automated data collection 176

Summary 177

Sample answers to self-test questions 179
