

SECOND EDITION

BIG DATA APPLICATION IN POWER SYSTEMS

EDITED BY
REZA ARGHANDEH
YUXUN ZHOU

Contents

<i>Contributors</i>	<i>xi</i>
<i>About the editors</i>	<i>xv</i>
<i>Preface, objective, and overview of the book</i>	<i>xvii</i>
<i>Acknowledgments for the second edition</i>	<i>xix</i>

SECTION A Harness the big data from power systems

1. A holistic approach to becoming a data-driven utility	3
John D. McDonald	
1.1 Introduction	3
1.2 Aligning internal and external stakeholders	6
1.3 Taking a holistic approach	7
1.4 “Strong” first, then “smarter”	8
1.5 Implementing an “Observability Strategy”	10
1.6 Increasing visibility with IEDs	11
1.7 Network response requirements	14
1.8 Integration before automation	15
1.9 Functional data paths: Keep it simple	16
1.10 From sensor to end user: The process	17
1.11 Customers > consumers > prosumers	21
1.12 New sources of data: Robotics and UAVs	23
1.13 Extracting value from data and presenting it	24
1.14 The transformation	25
1.15 Three case studies	26
1.16 Frankfort, Kentucky, and greenfield SCADA, SA	26
1.17 Unmanned aerial vehicles for vegetation management	28
1.18 Robotics for substation asset management	30
1.19 Conclusion	32
1.20 Looking ahead	33
References	34
2. Security and data privacy challenges for data-driven utilities	37
Carol L. Stimmel	
2.1 Introduction	37
2.2 Case studies: The state and scope of the threat	38

2.3 The digitized network increases vulnerability	44
2.4 The role of data analytics	48
2.5 Conclusion	50
References	51
3. The role of big data and analytics in utilities innovation	53
Jeffrey S. Katz	
3.1 Introduction of big data and analytics as an accelerator of innovation	53
3.2 Approaches to data-driven innovation	55
3.3 Integration of renewable energy	57
3.4 Grid operations	59
3.5 Cognitive computing on big data	63
3.6 Weather, the biggest data topic for power systems	65
References	67
Further reading	68
4. Big data integration for the digitalization and decarbonization of distribution grids	69
Nuran Cihangir Martin, Tania M. Vazquez Sanchez, Selene Liverani, and Anita Gianelli	
4.1 Introduction: Challenges toward a net-zero economy	69
4.2 Grid observability and controllability	72
4.3 Key drivers of the digital transformation in distribution grids	75
4.4 Losses and fault detection	81
4.5 Conclusions	84
References	85
Further reading	86
SECTION B Put the power of big data into power systems	
5. Topology detection in distribution networks with machine learning	89
Deepjyoti Deka and Michael Chertkov	
5.1 Introduction	89
5.2 Distribution grid: Structure and power flows	92
5.3 Properties of voltage magnitudes in radial grids	95
5.4 Topology learning with full observation	98

5.5 Topology learning with missing data	100
5.6 Experiments	104
5.7 Conclusions	107
References	107
6. Grid topology identification via distributed statistical hypothesis testing	109
Saverio Bolognani and Keith Moffat	
6.1 Introduction	109
6.2 Power distribution grid model	111
6.3 Voltage conditional correlation analysis	113
6.4 A distributed topology test	124
6.5 Conclusions	131
References	132
7. Learning stable local Volt/Var controllers in distribution grids	135
Zhenyi Yuan, Guido Cavraro, and Jorge Cortés	
7.1 Introduction	135
7.2 Grid modeling and problem formulation	138
7.3 Equilibrium functions depending only on voltage	143
7.4 Equilibrium functions with reactive power as an additional argument	146
7.5 Learning equilibrium functions from data	147
7.6 Case study	150
7.7 Conclusions	157
Acknowledgments	157
References	158
8. Grid-edge optimization and control with machine learning	161
Anamika Dubey, Daniel Glover, and Gayathri Krishnamoorthy	
8.1 Introduction	161
8.2 Optimal power flow methods for grid-edge coordination	162
8.3 Learning-based control/optimization at the grid edge	167
8.4 Future research directions	181
References	184

9. Fault detection in distribution grid with spatial-temporal recurrent graph neural networks	189
Bang Nguyen and Tuyen Vu	
9.1 Introduction	189
9.2 Use case and data description	192
9.3 Methodology	196
9.4 Results and discussions	204
9.5 Conclusion and future work	211
References	212
Further reading	215
10. Supervised learning-based fault location in power grids	217
Hanif Livani	
10.1 Fundamentals of SVM	217
10.2 Power system applications of SVM	220
10.3 Fault classification and location for three-terminal transmission lines	222
10.4 Fault location for hybrid HVAC transmission lines	229
10.5 Summary	233
References	233
11. Transient stability predictions in modern power systems using transfer learning	235
Maeshal Hijazi, Payman Dehghanian, and Shiyuan Wang	
11.1 Introduction	235
11.2 Background	240
11.3 The proposed framework	245
11.4 Numerical tests and analysis	250
11.5 Conclusions	264
References	265
12. Misconfiguration detection of inverter-based units in power distribution grids using machine learning	269
David Fellner, Thomas I. Strasser, and Wolfgang Kastner	
12.1 Introduction	269
12.2 Monitoring and detection framework	272
12.3 Employed approaches	277

12.4 Use case example	285
12.5 Conclusions	288
References	289
13. Virtual inertia provision from distribution power systems using machine learning	293
Simon Stock, Davood Babazadeh, and Christian Becker	
13.1 Introduction	293
13.2 Inertia support framework	299
13.3 Conclusions	317
References	318
14. Electricity demand flexibility estimation in warehouses using machine learning	323
Farzad Dadras Javan, Italo Aldo Campodonico Avendano, Ali Kaboli, Behzad Najafi, Amin Moazami, Sara Perotti, and Fabio Rinaldi	
14.1 Introduction	323
14.2 Methodology	331
14.3 Machine learning algorithms, correlation index, and utilized accuracy metrics	335
14.4 Results and discussion	338
14.5 Conclusion	342
Acknowledgment	343
References	343
15. The role of eXplainable Artificial Intelligence (XAI) in smart grids	349
Gokcen Ozdemir, Murat Kuzlu, Salih Sarp, Ferhat Ozgur Catak, Berhane Darsene Dimd, and Umit Cali	
15.1 Introduction	349
15.2 A brief overview of XAI and its tools	351
15.3 XAI-based big data applications in electric power systems	354
15.4 Explainability to end users and control room operators	362
15.5 Challenges and opportunities of XAI in electric power systems	363
15.6 Conclusion	364
Acknowledgment	364
References	364

16. Data-driven photovoltaic and wind power forecasting for distribution grids	371
Marco Pierro, Azim Heydari, David Moser, and Grazia Barchi	
16.1 Introduction	371
16.2 The role of RES power forecasting in modern power systems	372
16.3 Classification of PV and wind power forecasting approaches based on models, time horizon, and data	374
16.4 Accuracy of the PV/wind power forecasting models	377
16.5 Day-ahead residual load forecasting in a distribution grid with distributed PV generation	381
16.6 Conclusions	389
References	390
17. Grid resilience against wildfire with machine learning: Machine learning based detection, localization and mitigation of the impact of forest fires on power grids	393
Paroma Chatterjee, Salah Uddin Kadir, Anurag Srivastava, and Aron Laszka	
17.1 Introduction	393
17.2 Impact of wildfires on power systems	398
17.3 Current wildfire management techniques	400
17.4 Enabling power grid resilience to wildfire	410
17.5 Conclusion and future work	413
Acknowledgment	413
References	413
